Abedin Sherifi**

Summary:

In this coding assignment, PyCharm was used throughout. The following Python libraries were utilized: random, time, os, and matplotlib. Two python files were used to complete this coding assignment. The Random_Maze.py file generates a random maze with obstacles accounting for 30% of the total maze size. This newly generated maze is then saved as a .txt file which then gets opened and read in the Grid_Maze_Search.py file. The Grid_Maze_Search.py file solves the maze by first reading the maze from a text file from a directory and then using Breadth-First-Search (BFS) solving the maze. Cost function was also computed for each maze size by dividing the number of moves it took to solve the maze by the solve time. The start point on the maze is marked with "S" at the top left corner of the maze. The goal point of the maze is marked with "G" at the bottom right corner of the maze. Randomly generated obstacles are marked with "O" on the maze. The point robot is not allowed to visit an obstacle cell. The point robot is supposed to traverse the maze horizontally.

Results:

Figure 1 below summarizes the cost function for each grid(maze) problem. The BFS algorithm per the data below indicates that the cost function decrease as maze size increases. It can be observed that the maze size of 500x500 has the lowest cost function from the rest of the maze sizes.

Grid	Cost (Moves)	Time (Sec)	Cost vs. Time (Moves/Sec)			
10x10	28	0.000555276870728	50425.2949763847			
50x50	148	0.01541018486023	9604.03793610273			
100x100	298	0.060060262680054	4961.68326115176			
500x500	1498	2.027174949646	738.959407653293			

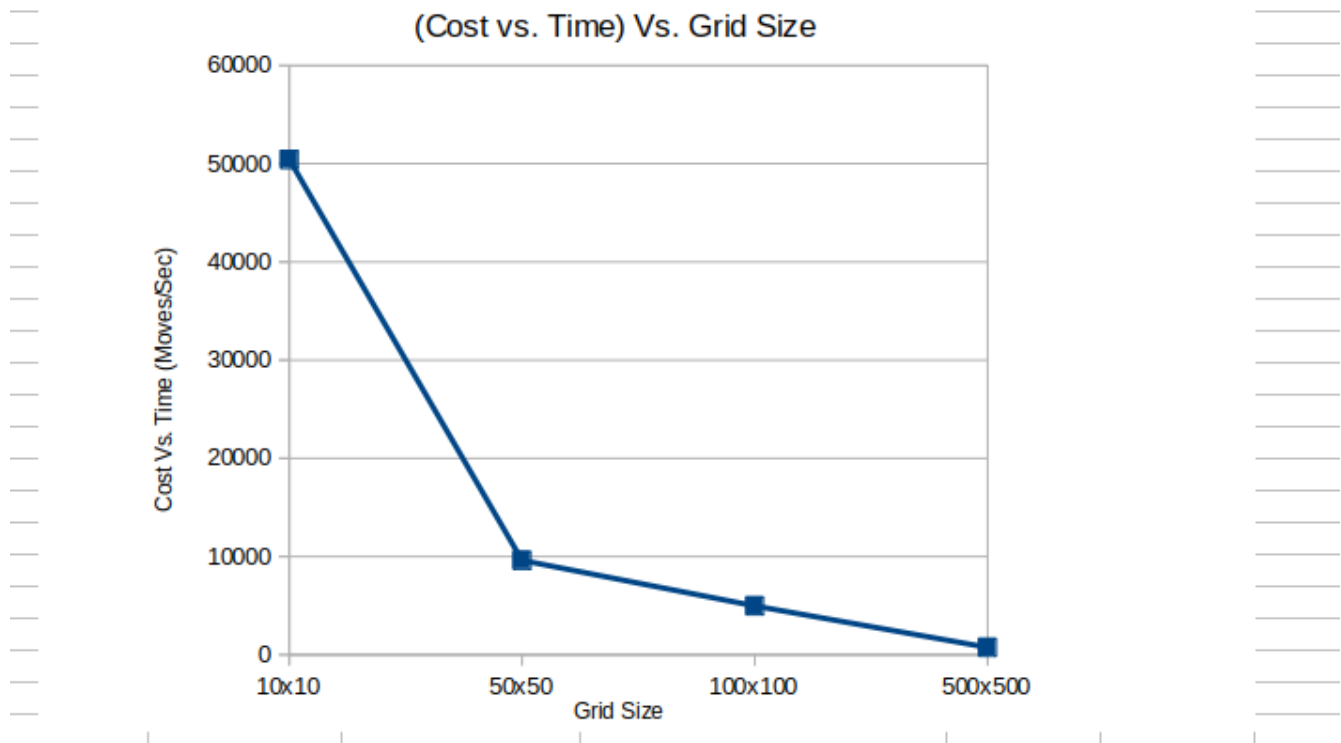

Figure 1. Cost Function

Maze = 10x10

The solved path provided by the algorithm is provided in figure 2 below as an array. The “S” start position is always (0,0). The path values are also plotted as shown below.

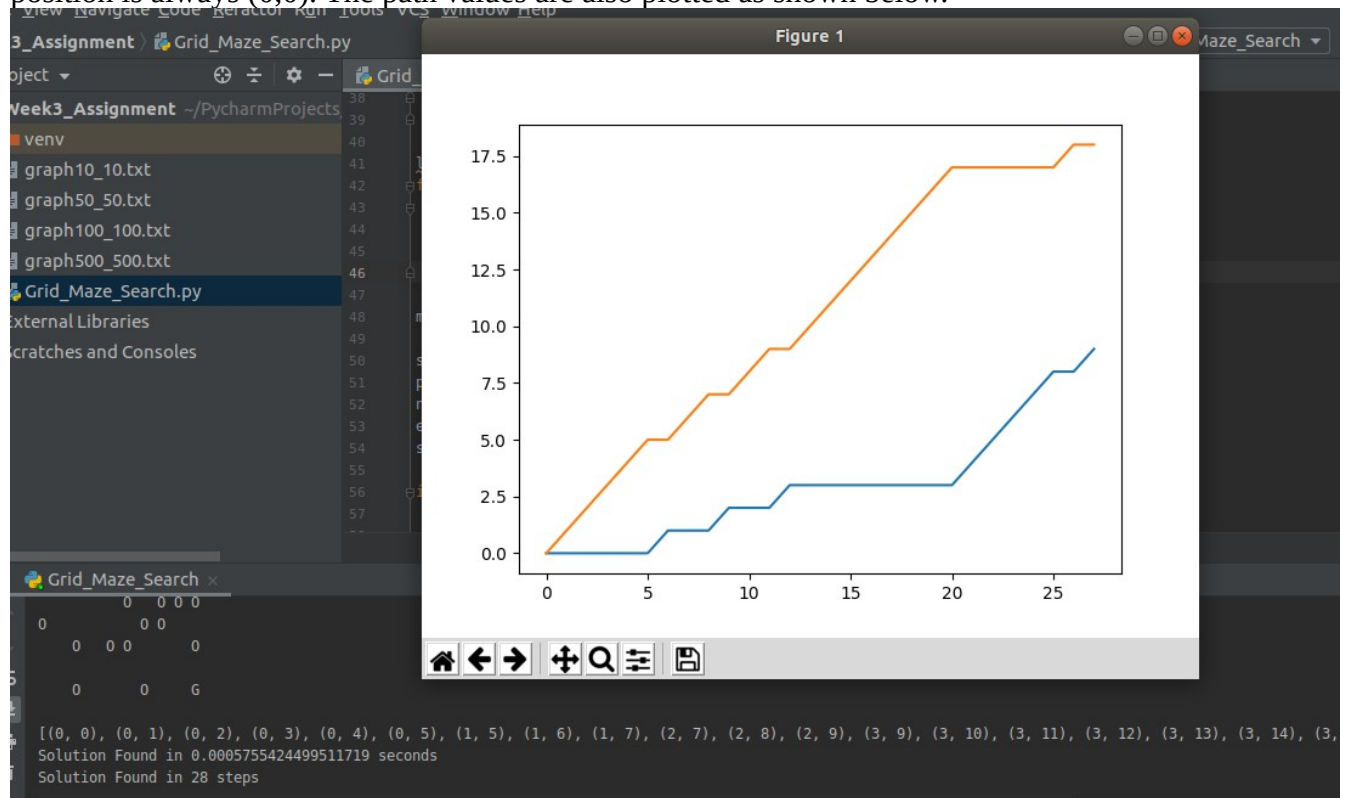

Figure 2. Maze 10x10 Result

Maze 50x50

The solved path provided by the algorithm is provided in figure 3 below as an array. The “S” start position is always (0,0). The path values are also plotted as shown below.

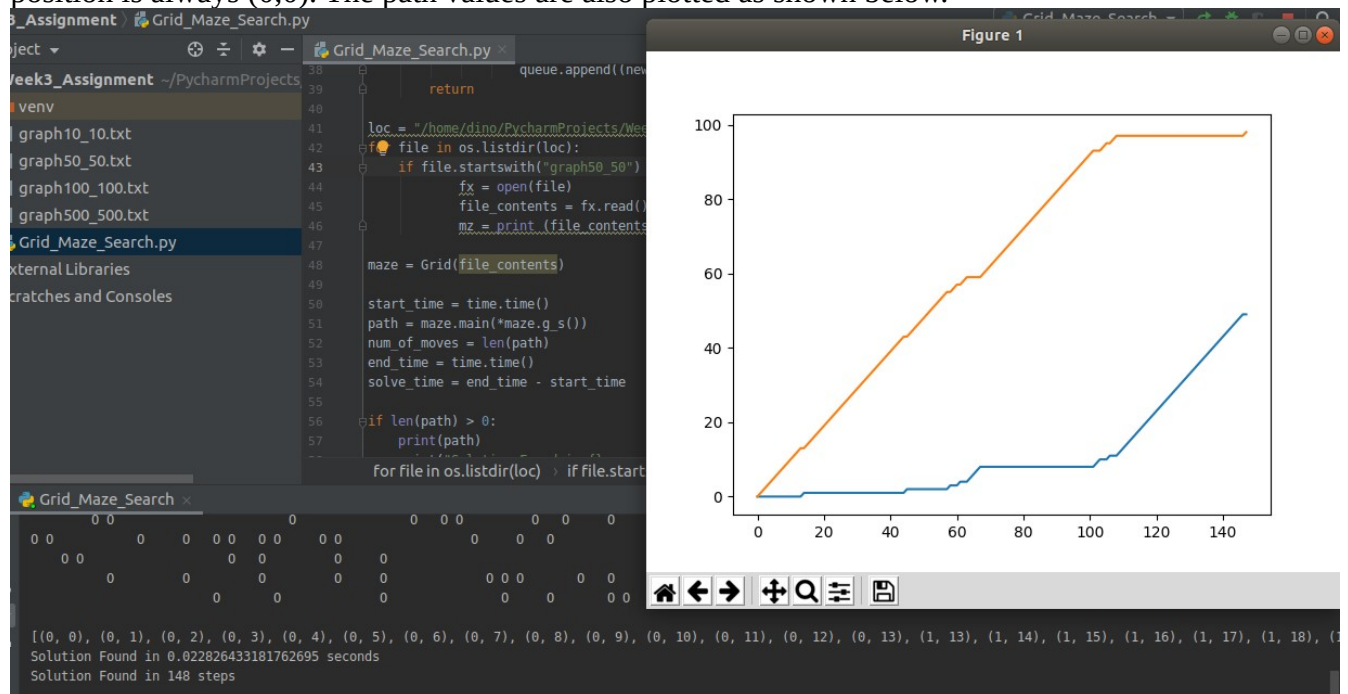

Figure 3. Maze 50x50

Maze 100x100

The solved path provided by the algorithm is provided in figure 4 below as an array. The “S” start position is always (0,0). The path values are also plotted as shown below.

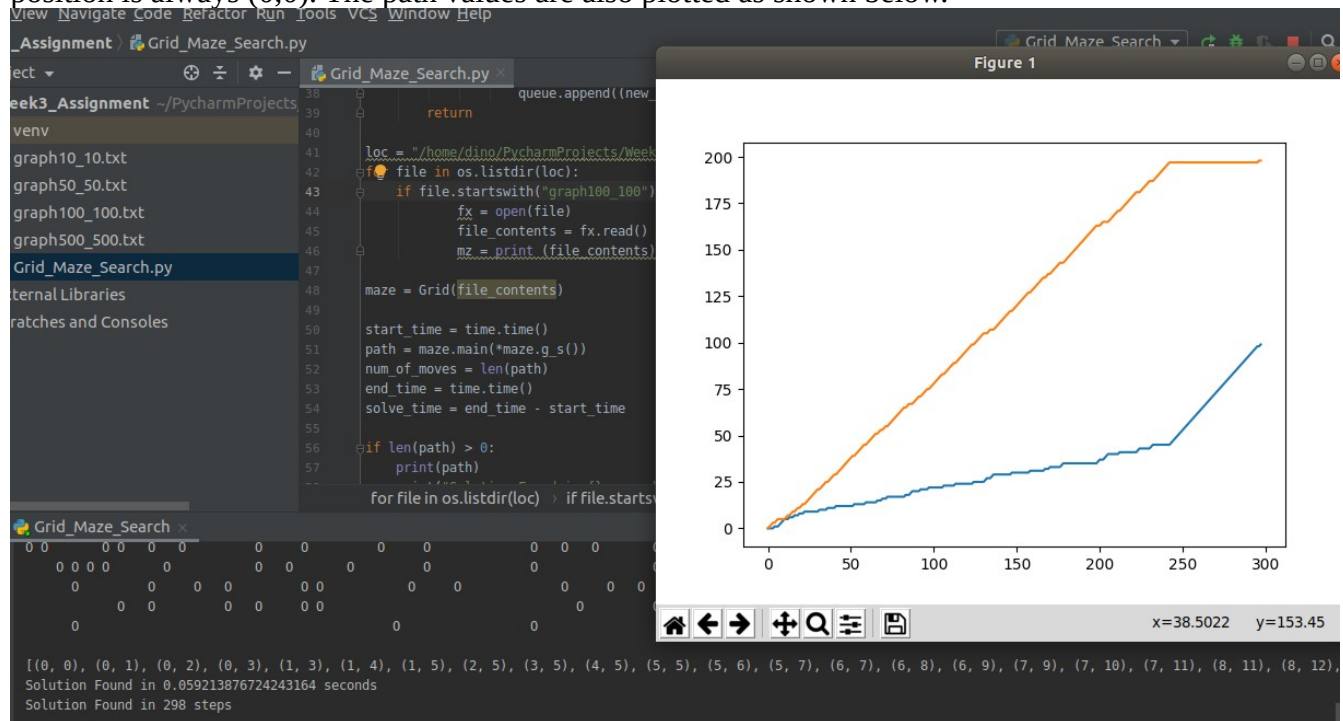

Figure 4. Maze 100x100

Maze 500x500

The solved path provided by the algorithm is provided in figure 5 below as an array. The “S” start position is always (0,0). The path values are also plotted as shown below.
